# Current consumption graphic

**Figure:** Intensity consumption graph for different pointer chase executions

# Energy decrease when instruction are moved in CCM

Moving instruction in CCM SRAM can overall improve energy consumption

# Energy decrease when instruction are moved in CCM

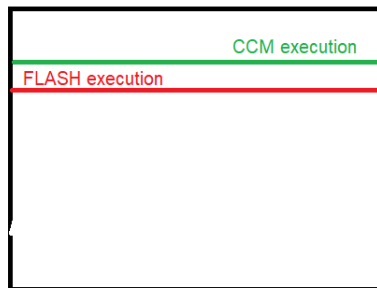

In high frequencies, intensity when the code is running from flash is lowered.

# Wait states impact on intensity

What we could observe if we had a sampling frequency of 48 MHz

What we really see

# Definitions & Examples

## Definition

A **prime number** is a number that has exactly two divisors.

## Example

- 2 is prime (two divisors: 1 and 2).
- 3 is prime (two divisors: 1 and 3).
- 4 is not prime (**three** divisors: 1, 2, and 4).

You can also use the `theorem`, `lemma`, `proof` and `corollary` environments.

# Theorem, Corollary & Proof

Theorem (Mass-energy equivalence)

$$E = mc^2$$

Corollary

$$x + y = y + x$$

Proof.

$$\omega + \phi = \epsilon$$

# Equation

$$\cos^3 \theta = \frac{1}{4} \cos \theta + \frac{3}{4} \cos 3\theta \quad (1)$$

## Example (Theorem Slide Code)

```

\frametitle{Theorem}  
\begin{theorem}[Mass--energy equivalence]  
$E = mc^2$  
\end{theorem}
